

Tasks

Question: 1.

Draw a labelled diagram of a desktop PC, clearly marking the motherboard, CPU, RAM, GPU, and both HDD and SSD storage component?

Ans:

Question: 2.

Create a comparison table showing the main differences between HDD and SSD storage in terms of speed, durability, and typical use case <brr><brr><am>< strong>Hint: Think about which one is faster, which is more shock-resistant, and where you would usually find each type (laptop, gaming PC, etc.). </am>?

Ans:

Feature	HDD (Hard Disk Drive)	SSD (Solid State Drive)
Speed	Slower	Faster
Durability	Less durable, can be Damaged by shocks	More durable and shock-resistant
Storage Capacity	Usually large and Cheaper	usually smaller and more expensive
Noise	Make noise because Of moving parts	Silent, no moving part
Power Consumption	Uses more power	Uses less power
Typical Use case	Desktop PCs, backup Storage, large files	Laptops, gaming PCs, fast boot and apps

Question: 3.

Write a short explanation (2-3 sentences each) describing the role of the CPU, RAM, and GPU in running a game like PUBG or Free Fire on a PC?

Ans: CPU (Central Processing unit)

The CPU is the brain of the computer. It processes all game instruction, control player movement, manages enemies, physics, and game logic.

Ram (Random Access Memory)

RAM is the temporary memory of the computer it stores the game's data while you are playing such as maps textures, and player information.

GPU (Graphics Processing units)

The GPU is responsible for rendering all the graphics in the game. it creates high-quality visuals effects shadows and animations making the game looks smooth and realistic.

Question: 4.

Imagine you want to upgrade your PC to run the latest version of FIFA smoothly. List which hardware components you would consider upgrading and explain why for each?

Ans:1. CPU (Processor)

The CPU is the brain of the computer. a faster and newer processor help the game run smoothly reduces lag improves overall performance, especially during online matches.

2. GPU (Graphics card)

The GPU is responsible for rendering game graphics. upgrading to a better graphic card gives higher FPS (Frames per second) better visual quality.

3. SSD (Solid state drive)

Replacing an HDD with an SSD makes the game load much faster. it also reduces loading time.

5. Power supply (SMPS)

If I install a new graphics card or processor, I may also need a higher-wattage SMPS power and protects the component from damage.

6. Cooling system (Optional)

A better CPU cooler or extra cabinet fans help keep the computer cool during long gaming sessions. This prevents overheating and maintains good performance. Ta Tasks
