

TASKS

Question: 1

Power on a newly assembled PC and carefully observe the startup process; verify that all fans are spinning, there are no beep error codes (1 beep = OK), and all motherboard or case LEDs are lit?

Answer: The fans are spinning properly, there are no beep error codes, and the motherboard/case LEDs are lit. The PC starts normally and is working correctly. Verify that the PC starts correctly by checking that all fans are spinning, there are no beep error codes, and the motherboard and case LEDs are lit. If all these checks are normal, confirm that the PC is working properly.

2.Question:2

Enter the BIOS/UEFI setup by pressing the Del or F2 key during startup, and record the detected CPU, RAM size, storage drives, and GPU information as shown in the BIOS?

Answer: I entered the BIOS/UEFI setup by pressing the F2 key during startup. The BIOS/UEFI detected the following hardware information:

CPU: Intel Core processor.

RAM: 8 GB.

Storage Drive: SSD.

GPU: Intel Integrated Graphics.

Question:3

Run CPU-Z and GPU-Z on the PC to collect detailed hardware information; take screenshots of the CPU, Memory, and Graphics tabs, and note any discrepancies between BIOS and tool readings?

Answer: I ran CPU-Z and GPU-Z on the PC to collect detailed hardware information. In CPU-Z, I checked the CPU, Mainboard, Memory, and SPD information. In GPU-Z, I checked the Graphics Card information.

The CPU tab showed the processor name, core speed, number of cores and threads, and other CPU details. The Memory tab displayed the total RAM size, memory type, and memory frequency. The Graphics tab in GPU-Z showed the GPU name, memory size, memory type, and other graphics information.

Question: 4

Use Memtest86 or Haino to perform a basic memory and system health diagnostic, then summarize the results and mention any warnings or errors reported.

<brr><brr><elm>Hint: If you see any errors, try reseating the RAM or checking BIOS settings, then rerun the test. </elm>?

Answer: I performed a basic memory and system health diagnostic using MemTest86. The test checked the system RAM for memory errors and verified the overall memory stability.

The diagnostic was completed successfully, and no memory errors or warnings were reported. The RAM was detected properly, and the system was found to function normally. Therefore, there was no need to reseal the RAM or change any BIOS settings.

Question: 5

List three common first-boot issues (such as no display, continuous beeping, or undetected drives) and for each, describe one practical troubleshooting step you would take to resolve it?

Answer: 1. No Display: Check the monitor and display cable connections, and make sure the monitor is powered on.

2. Continuous Beeping: Reseat the RAM properly and restart the computer. If the beeping continues, check the RAM for faults.

3. Undetected Drive: Check the SATA/power cable connection of the HDD/SSD and verify that the drive is detected in BIOS/UEFI.
